

Fungavir™ is known as the ultimate, 100% natural, fast and effective nail fungus treatment today. Thousands of our customers are thrilled at how they haven't had even a hint of an infection since using Fungavir™. In fact, they're so happy that they told us they'll never buy any of the 'cheap chemical-based alternatives' ever again. Here's why:

You see, most nail fungus treatments fail to effectively eliminate the fungus and heal the area, allowing fungus to grow back. In addition they dilute their products by adding fillers like water and glycerin, which makes the product less effective and costly over time. Which is why the 'chemical based alternatives' everyone buys in pharmacies might relieve some of the symptoms at first, but those troublesome infections always come back - sometimes even worse than ever! Isn't it time you had total relief that's 100% natural?

Most nail fungus treatments have less than top-notch purity, and are packaged in an improper dose. Only Fungavir™ has it all. Fungavir™ was developed to adhere to the strictest quality standards and contain more bioavailability and effective ingredients than any other product, hands down. Which is why people are calling it the 'Ultimate Nail Fungus Treatment'.

Fungavir's™ proprietary formula utilizes 18 extensively researched ingredients that are at the top of their respective health goals in terms of quality standards, scientific research, and purity. We recommend comparing the ingredients with the competition. **We are confident that you will not find a better treatment for nail fungus on the market.**

Fungavir™ Follows the Highest Quality Standards

Fungavir™ contains **18 tested ingredients that meet the strength and purity guidelines of the USP/NF (United States Pharmacopeia–National Formulary).** Fungavir™ is manufactured in the United States in an FDA registered laboratory that exceeds industry standards. Our manufacturing facility is GMP-certified and abides by the strictest FDA recommendations.

Fungavir™ is the Best Nail Fungus Treatment on the Market

- **Maximum Strength Double-Action Formula**
Treats the core of the problem underneath the nail
- **Heals and Eliminates Infections**
Kills the fungus while healing the affected area
- **Reduces Nail Fungus Fast**
Quickly clears up nail fungus and promotes regeneration
- **Effective and Safe**
Utilizes only the safest and most powerful anti-fungal ingredients
- **No Side effects**
All natural formula with no adverse reactions
- **100% Risk-Free Results**
Feel confident and secure with our 100% 60 day money back guarantee

Fungavir™ Gets to the Root of the Problem

Fungavir™ sets itself apart from other nail fungus treatments. Due to the fact that nail fungus is usually under the surface of the nail, most other topical nail fungus treatments do not work. Fungavir™ is designed to attack nail fungus from its root, and to absorb under and around the nail. At the same time its powerful ingredients strengthen the surrounding tissue so that your body can repair the affected areas. Any discoloration brought about by nail fungus is removed by Fungavir's™ powerful ingredients.

For these reasons, **it's crucial to apply this solution daily during the infection,** so you can ensure your nail fungus is a thing of the past and stops it from ever coming back, once and for all.

Fungavir™ stands above other solutions by attacking the problem at its root. Fungavir™ is a painless, risk-free alternative to prescription drugs and the many negative side effects they're known for. It's a unique, maximum strength, proprietary blend of ingredients that is specially formulated to target tough infections and prevent recurrences.

Fungavir™ is proud to be endorsed by doctors and biomedical researchers alike. Fungavir's™ formulation of effective ingredients and strong name recognition have brought it praise from some of the finest professionals in the industry.

Why is Fungavir™ So Effective?

Fungavir™ is a breakthrough proprietary supplement that effectively combines the most powerful and extensively researched ingredients, giving you an all-in-one solution to get rid of nail fungus. Every single ingredient in Fungavir was hand-picked by a team of medical doctors and scientific researchers, based on clinical data and designed to get rid of all three types of nail fungus: Molds, Dermatophytes and Yeasts.

Fungavir™ contains 18 tested ingredients that meet the strength and purity standards of the USP/NF (United States Pharmacopeia–National Formulary). Each ingredient was carefully researched and included based on clinical data. No other non-prescription solution comes close in terms of quality and purity of ingredients.

The proprietary formula developed by Fungavir™ takes about 3-4 weeks for you to start seeing its effects. But be patient, it takes about 3-6 months to totally get rid of nail fungus and for new healthy nails to grow and replace the old infected nails. Of course how long it takes to get rid of nail fungus depends on each individual condition. Daily treatment of Fungavir™ is required to not only eliminate the nail fungus, but also to grow healthy nails in place of the infected ones. Please use Fungavir™ at least twice a day, and allow it to absorb into the nail for 1/2 hour.

Fungavir's™ - Proprietary Blend of Ingredients:

Undecylenic Acid (USP 25%) is derived from castor oil, undecylenic acid is a potent antifungal agent. 25% is the strongest concentration available for topical use. Undecylenic Acid has been approved by the FDA and proven effective in relieving itching, burning, and other problems associated with fungi and other skin irritations.

Mineral Oil is colorless, odorless, light mixtures of higher alkanes from a mineral source, particularly a distillate of petroleum. Often used as a moisturizer to treat or prevent dry, rough, scaly, itchy skin and minor skin irritations.

Sweet Almond Oil (*Prunus amygdalus dulcis*) helps relieve irritation and itchy, dry, inflamed skin. *Prunus Amygdalus Dulcis* adds to the treatment by providing essential fatty acids and vitamins A, B1, B2, B6 and E, which reduces inflammation and helps with healing.

Flax Seed Oil (*Linum usitatissimum*) has been used in traditional medicine to treat a variety of conditions. Flax Seed Oil nourishes and moistens cell membranes, reduces inflammation, boosts metabolism and energy.

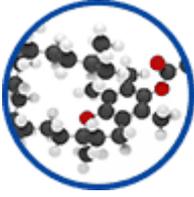

Tea Tree Oil (*Melaleuca alternifolia Oil*) is probably the most well known antifungal oils. Many clinical studies have been done to prove tea tree oil's effectiveness in fighting fungus.

Aloe Vera Leaf Extract (*Aloe barbadensis*) is needed for promoting healing, and it has many antibacterial and antifungal qualities. The healing and rejuvenative properties of Aloe Barbadensis have been well researched.

Canola Oil is produced from the seed of any of several varieties of the Brassicaceae family of plants. Canola is a phenolic compound that contains antioxidant properties, omega-6 and omega-3 fatty acids.

Vitamin E (*Tocopheryl Acetate*) has been proven successful in a multitude of case studies to effectively treat and eliminate nail fungus and yellow nails. D-Alpha-tocopheryl acetate is necessary to keep the skin moist and help the healing process.

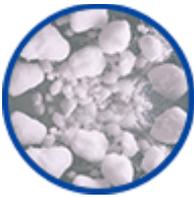

Bee Propolis Extract (*Apis mellifica*) has long been used for its antibiotic, anti-inflammatory and antiseptic properties. It is an odorless antibiotic and is used as a key function in Fungavir to cleanse and heal the wounds as it is applied. Propolis has been used as a natural medication for centuries because of its ability to speed the healing process.

Black Walnut (*Juglans nigra*) has astringent and detergent properties that are used to get rid of a variety of fungal infections. The American Indians used it to cure ringworm and other fungal infections. It is a well known and strong antifungal agent that is now used in modern science as well.

Menthol comes from peppermint and other mint oils which have local anesthetic and counter-irritant qualities. Menthol is often used a topical analgesic to relieve minor aches and pains.

Camphor Oil (*Cinnamomum camphora*) has been used for generations as a disinfectant, insecticide and germicide. Camphor absorbs easily into the skin and has significant anesthetic and antimicrobial properties.

Clove Bud Oil (*Eugenia caryophyllus*) has been used by Chinese physicians to treat a number of fungal infections including ringworm, athlete's foot and nail fungus with huge success over many years. It is also a key ingredient in Fungavir and is not used in many other nail fungus treatments.

Jojoba Oil (*Simmondsia chinensis*) is used as a healing agent for skin ailments because of its antimicrobial properties. Jojoba oil is a known fungicide and protects the skin from bacterial infection.

Chia Oil (*Salvia hispanica*) is derived from the Chia plant. It is rich in a number of nutrients, including omega-3-acids, calcium, iron, vitamin-c, potassium and anti-oxidants. It also has a high fiber content, which helps to maintain a healthy balance in the digestive tract, thereby preventing yeast and candida overgrowth.

Lemongrass Oil (*Cymbopogon citratus*) is a natural chemical antiseptic and has properties that are both analgesic and which reduces inflammation and pain. Lemongrass is a known anti microbial and bacterial agent which acts to inhibit microbial and bacterial growth in different parts of the body.

Lavender Oil (*Lavandula angustifolia*) penetrates the skin to heal infections and is regularly used to fight ringworm and other fungal infections. It is also well known to decrease inflammation and itching. It has been used medicinally throughout history and now in more modern times.

Manuka Oil (*Leptospermum scoparium*) is one of the key ingredients in Fungavir's™ solution, yet you won't find it in most nail fungus treatments. Most people don't know the power of Manuka Oil. It has been said to be nature's greatest secret when it comes to skin problems such as athlete's foot, fungus and rashes. The scientific community is just starting to appreciate the Manuka tree for its medicinal qualities yet the Maoris of New Zealand have used Manuka oil for hundreds of years in combating different ailments.

What is Nail Fungus?

Did you know that over 50 million people have nail fungus? It is a common infection, known by a few names, and with a few causes. Often, it is called Onychomycosis (*tinea unguium*) or nail ringworm.¹ It can be found on finger nails as well as toenails. It tends to grow and further infect a person's nails when the hands or feet are in warm, moist and confined places, like shoes or gloves. Yes, shoes are the ideal breeding place for nail fungus because of the combination of moisture, high temperature heat and darkness. **It often starts with a small white or yellow discoloration** which you see beneath the tip of your toenail or fingernail. Soon, it spreads and the whole nail becomes yellow, brown or even black and it may spread to other nails as well. Your nails often becomes thick and show signs of cracking or crumbling edges. Beneath the nail bed of your fingers or toes the fungal infection breeds and grows. Often,

people complain that there is associated pain in addition to looking unpleasant. And, in addition to **spreading to other nails, it can also spread and infect other people.**

What are the Causes and Characteristics of Nail Fungus?

Because nail fungus or Onychomycosis is infectious, **many people pick it up from others in locker rooms, public showers and pools or from family members.** But you can get it even if you never go into a locker room. Your shoes and socks keep your feet warm and moist, and fungal infections can easily grow there. Early signs of cracked or discolored nails should be carefully monitored. Athlete's foot can spread to other areas and can grow into the nail bed. **As we get older, our bodies are able to pick up all kinds of infections easier, and nail fungus is no exception.**

A manicure or pedicure in a salon is often a place where one picks up an infection. If the salon does not sanitize or even sterilize their equipment, they will spread the infection like a rapid fire. When they use equipment that is not cleaned properly or not sterile, the salon will spread the fungus from one person to another, and to both finger and toe nails. In addition, many women get fungal infections when acrylic nails are not removed and moisture accumulates under the nail. **People who work with their hands in water or rubber gloves for extended periods of time are also susceptible to nail fungus.** This job hazard is a real problem for many people. Of course, people who work with their feet in water or heavy work boots have the same problem.

There are **3 common kinds of nail fungus**, the most common is caused by a **dermatophyte fungus.**² In this form of fungus, the infection gets into the space between the toe or finger and the nail edges or the skin on the edges. First, the nail becomes yellow and in severe cases, the nail can separate from the lower nail bed. This is more common in toenails where the nail may get brittle and can fall off. It usually becomes a darker brown or even black color.

Nail fungus can also be the result of a **yeast infection, Candida Albicans.** This type of infection is the common kind on fingernails. Usually, the yeast infection type of nail fungus causes the finger nail to have a yellow or green or foggy look to it. This kind of Nail Fungus is more common in fingernails when the hands have to be in water a lot of the time. A yeast infection can set into a crack or cut in the nail or under the nail bed. People who work in heavy boots, or who wear tennis shoes all the time, or sweat a great deal, may get this kind of nail fungus on their toes.

Some people get a nail fungus caused by **mold**, although it is less common. When someone walks barefoot outside, there is a chance, although minute, of catching a mold infection on the feet which can spread to the toenails. This kind of fungus may enter the nail through a crack or jagged edge in the nail or a cut in the toenail.

How Can You Prevent Nail Fungus?

If you can prevent nail fungus from occurring, you are of course better off than trying to heal the infection once it starts. The following are some prevention ideas to keep you as safe as possible:

Change shoes and socks whenever they get wet or sweaty. Wear open shoes or sandals, if you can, or go without shoes (at home) if possible. Use some foot powder in your socks and shoes to keep your feet dry. Keep your feet dry after they sweat. Change your socks and shoes if you are involved in any sports or exercise. Wear sandals or flip flops in locker rooms, pool areas or public showers areas. For a manicure or pedicure always bring your own tools. Do not allow them to use equipment or tools that have been used on other clients. Never put your hands or feet into basins used by others unless you are sure it has been sterilized not just washed. Make sure that the shoes you wear are not too tight for your feet. If you have to wear gloves, take them off as often as possible.

Why use Fungavir™ Instead of Prescription Nail Fungus Treatments?

Usually, doctors recommend very strong medication that you swallow. These **contain high doses of antifungal drugs that can and will adversely affect your body.** While working to clear the fungal infection, they are also working on your liver, bone marrow and other internal organs. It is not always safe to ingest antifungal medications into your body. In order to be effective, you would need to take these pills for 4 to 6 months and at the same you are exposing your liver, bone marrow, stomach, intestines and skin to very strong medication. There are many side effects, which is why the doctor will order a blood test once a month. And if you are taking other medications you should tell your doctor. You could be at risk if you have liver, heart, stomach or many other medical complications. **These medications often cause diarrhea, stomach pain, and even vomiting.** The signs may be discoloration or light feces, blood in the stool, and other ailments. Many people complain of skin rashes that do not go away or of itching, hives or welts. Other side effects like dark urine, pale stools, throat pain have been experienced. **If you decide to take a prescription antifungal medication, make sure your doctor performs monthly blood tests during the treatment.**

Fungavir™ is a different kind of treatment. You do not swallow it, but put it directly on the toenail or fingernail. **Fungavir™ is a safe topical treatment made of all natural ingredients.** It does not go into the body to cause damage to any organs. It is very effective, and it works well on all kind of nail fungus.
